spp. - means more than one species of the plant family is low-water. var. - means more than one variety of the plant is low-water. | \*Two drops in full sun \*\*Three drops in full sun

### Watering Instructions

On average, the Okanagan gets about 11 inches (28 cm) of natural precipitation annually. The amount of additional water a plant will need in the growing season will be affected by the type of soil it is growing in and whether or not the soil has been covered by mulch (which helps retain moisture!).

The water needs indicated (1 or 2 drops) are for mulched, average, well-drained soil with good organic content and after the plants are established. Plants in sandy soils will need a bit more water, and plants in clay soils will do well with less than the suggested supplementation.

It is important to water deeply and less often so that water soaks into the soil and encourages deep root growth. A deep watering would be an application of one inch. (Measure how long that takes by putting out tuna cans within the area next time you water.) Any supplemental watering that is required is needed most in our dry summer months.

To attract pollinators, choose plants with different bloom times.

### FireSmart Legend Priority Zones

- Immediate Zone 0-1.5 m
- Intermediate Zone 1.5-10 m
- Extended Zone 10-30 m
- Extended & Beyond 21-30+ m
- Generally considered fire-resistant, however more research is required to determine which zone is appropriate for use. Use with caution as some may pose more risk than others.
